

Project Design Phase
Problem – Solution Fit Template

Date	03 October 2026
Team ID	SWTID-2026-4647
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem

The school IT helpdesk receives **multiple incident requests daily** from students and teachers, covering issues such as:

- Wi-Fi connectivity failures
- Projector malfunctions
- Password/login problems
- Slow or hanging computers

Currently, IT staff must **manually review each ticket** to assign the correct category and subcategory. This process is:

- Time-consuming
- Error-prone
- Inefficient as request volume increases

This leads to **delays in ticket resolution**, inconsistent classification, and higher workload for IT staff.

Solution

The proposed solution is an **automated ticket classification system** using **ServiceNow Flow Designer**.

Key features:

- **Auto Classification:** Short descriptions are scanned for keywords (Wi-Fi, Projector, Password, Slow). The system automatically assigns the correct Category and Subcategory.
- **Custom Table:** Incident Workflow table stores structured ticket records with fields like Caller, Category, Subcategory, State, Assigned Group, and Assigned To.
- **Dependency Mapping:** Subcategory options dynamically change based on the selected Category.
- **Notification:** Automated email confirmation sent to the caller upon ticket creation.
- **No-Code Implementation:** Entire process is built using Flow Designer, ensuring easy maintenance and scalability.

Fit

This solution directly addresses the pain points:

- **Reduces manual effort** for IT staff by eliminating repetitive classification tasks.
- **Improves accuracy** by enforcing consistent keyword-based mapping.
- **Enhances efficiency** with real-time classification and immediate notifications.
- **Scales easily** as new categories/subcategories can be added without coding.
- **Boosts user satisfaction** by providing faster ticket routing and quicker resolutions.

Purpose Alignment

- **Solve complex problems:** Automates classification in a way that fits the behavior of students/teachers (simple short description entry).
- **Increase adoption:** Uses ServiceNow's existing platform, familiar to IT staff.
- **Sharpen communication:** Automated email notifications improve transparency.
- **Build trust:** Frequent annoyances (Wi-Fi, password issues) are solved faster, increasing confidence in IT support.
